

## PEGASUS BOOST

The Pegasus Boost provides a clean, transparent boost useful for making your guitar sound fuller, pushing your amp into overdrive, or stacking with your current drive and distortion pedals to create new and exciting tones.

One gain knob lets the user dial in the precise amount gain required for any situation. Alone, the Pegasus gives an un-tempered gain boost without overtly accentuating or attenuating any part of your tone. When used with other pedals like overdrives, the Pegasus can make your tone thicker and more complex as the pedals cooperate with one another.

One simple boost control gives a wide variety of tones, especially when used with an amp on the verge of break up, overdrives, and distortions.

BOOST

The Boost increases gain as you turn clock-wise, up to approximately 20 dB. It provides transparent boost without becoming strident or sterile in the upper guitar frequencies.

Power Requirements:  
9 VDC adapters only  
<15mA current draw
